

# Opportunities for producing thermal energy from grass pellets

**Roger Samson**

Resource Efficient Agricultural Production (REAP)-Canada  
Ste Anne de Bellevue, Quebec  
[rsamson@reap-canada.com](mailto:rsamson@reap-canada.com)

# REAP-Canada

- Providing leadership in the research and development of sustainable agricultural biofuels and bioenergy conversion systems for greenhouse gas mitigation
- 18 years of R & D on energy crops for liquid and solid biofuel applications
- Working in China, Philippines and West Africa on bioenergy and rural development projects

# Bioenergy Follows the Emergence of Food Production Systems

- 10,000 years ago humans learned to grow food from the land as a response to exhaustion of food supplies from hunter gatherer lifestyle
- Today bioenergy is emerging as a response to exhaustion of fossil energy supplies and the climate change problem
- One of the greatest challenges of humanity is to create resource efficient bioenergy systems from our agricultural lands

# Optimizing Bioenergy Development for Energy Security

*To economically provide large amounts of renewable energy from biomass we must:*

1. As efficiently as possible capture solar energy over a large area
2. Convert this captured energy as efficiently as possible into useful energy forms for energy consumers

# Biofuels Research at REAP-Canada began in 1991

**Followed USDOE lead to develop  
perennial crops on marginal lands**

# Warm Season Grasses

**C4 Grasses  
such as  
switchgrass  
are ideal  
bioenergy  
crops**

- **Moderate to high productivity**
- **Stand longevity**
- **Drought tolerant**
- **High nutrient use efficiency**
- **Low cost of production**
- **Adaptability to marginal soils**
- **Benefit biodiversity and soil fertility**
- **Minimizes impact on food inflation**

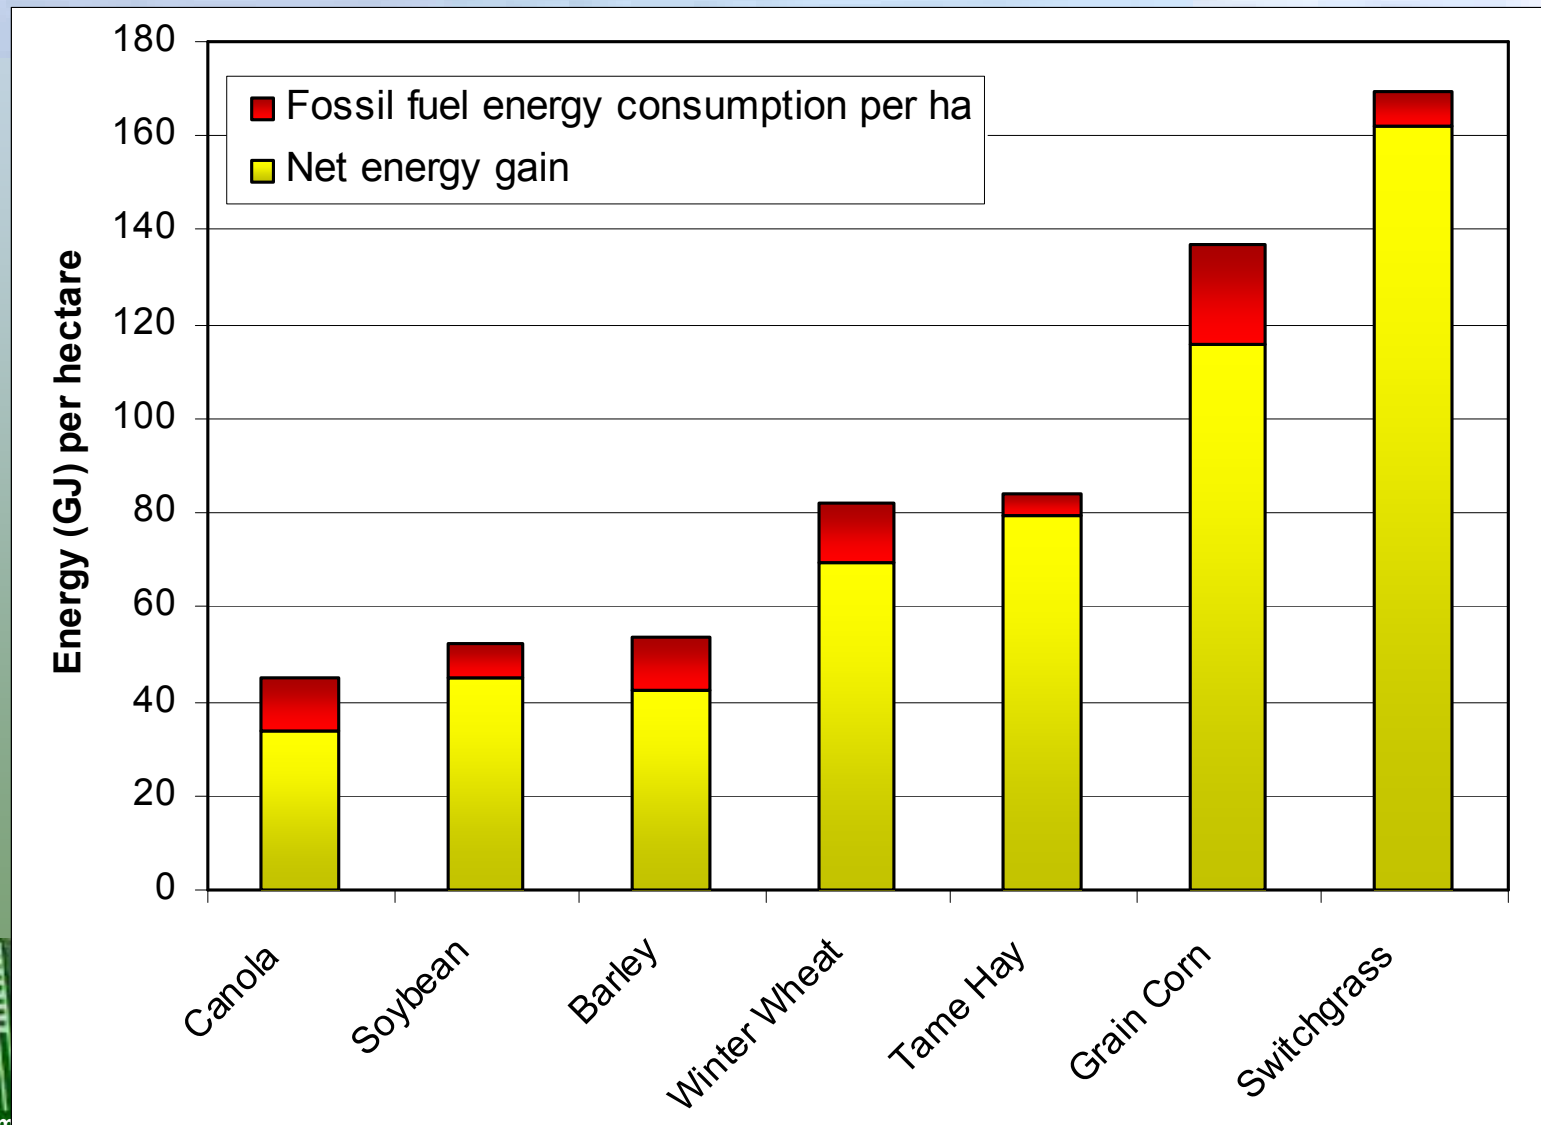

# Fall Yield of Switchgrass Cultivars at Ste. Anne de Bellevue, Quebec (1993-1996)

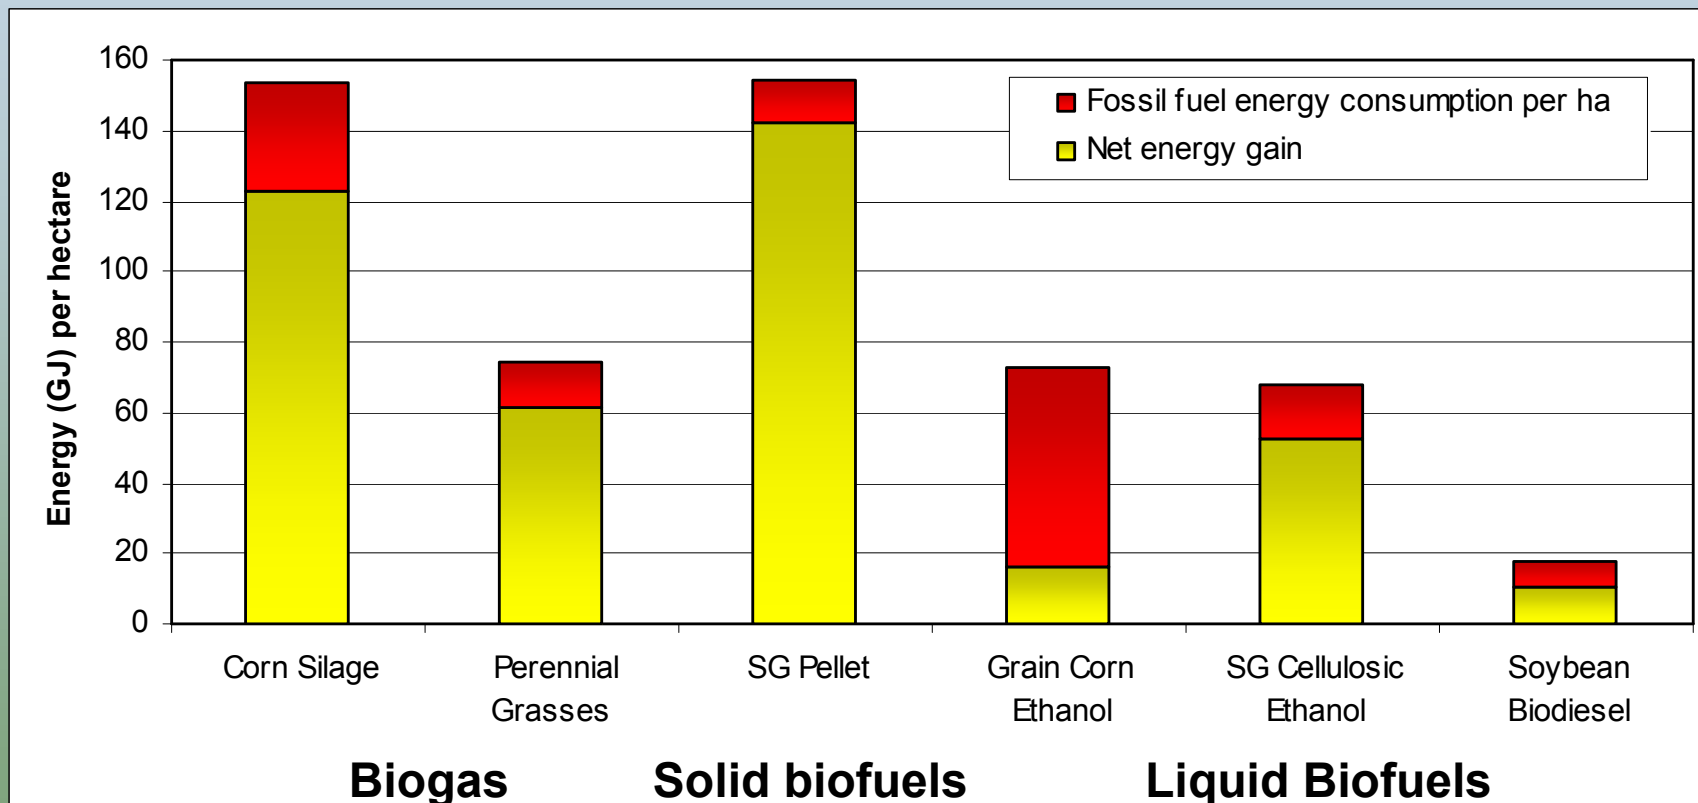

# Solar Energy Capture and Net Energy Gain of Ontario Field Crops (Samson et al., 2008)

# Assessment of Net Energy Gain from Ontario Farmland using various Biomass and Bioconversion Options (Samson et al., 2008)

SG=Switchgrass

## Switchgrass Harvesting Operations

## Bale Transport

## Bale processing at a pellet mill

## Pelleting Facility

# Reasons to Densify Herbaceous Biomass

- Convenient for handling and storage
- Increased energy density (smaller storage and combustion systems)
- Reduces fire risks
- More control over combustion
  - Higher efficiency
  - Lower particulate load

# Bioenergy Capital Costs Investment Requirements

(\$ per GJ Output Energy plant)

**Grass Pellet**  
\$5/GJ

**\$6 million USD capital investment, producing 60,000 tonnes/yr**

**Corn ethanol**  
\$24/GJ

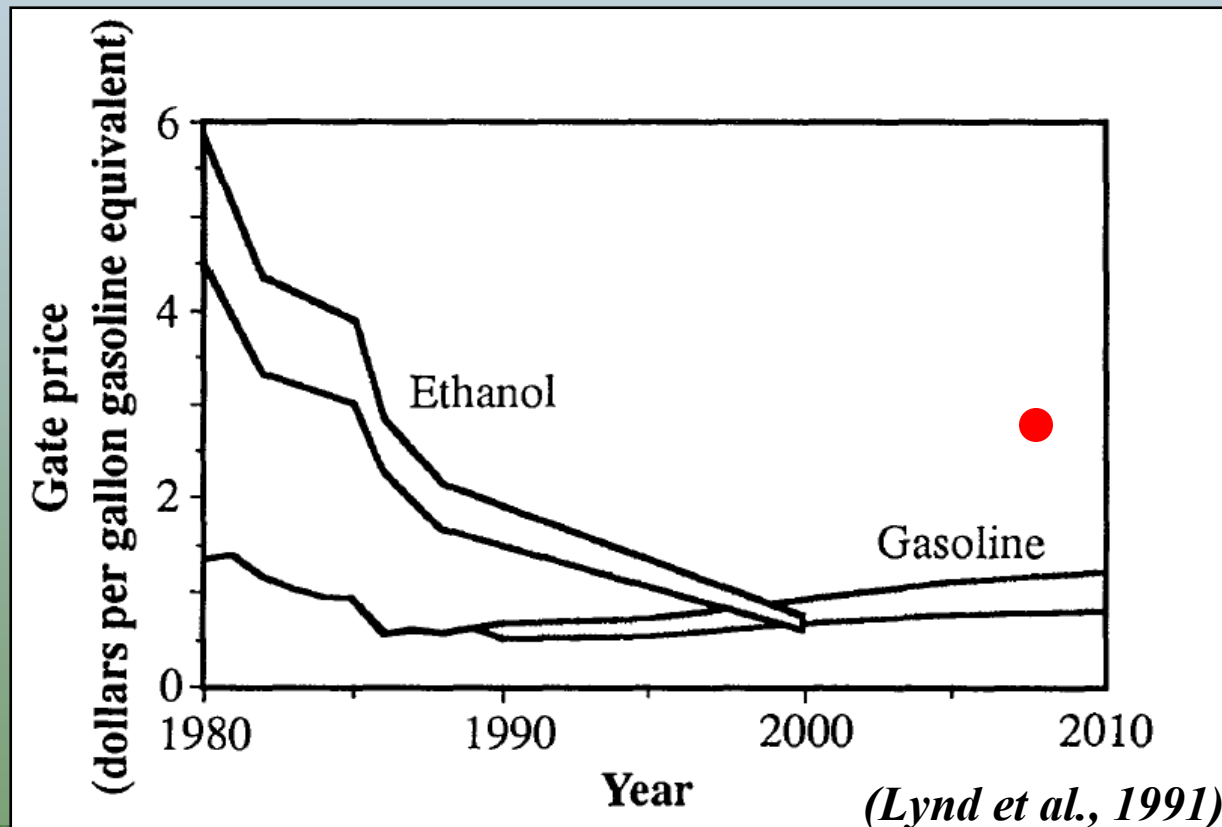

**\$102 million USD capital investment, producing 200 million L/yr**

**Cellulosic ethanol**  
\$263/GJ

**\$500 million USD capital investment, producing 90 million L/yr (globe and mail, march15, 2008)**

# Cellulosic ethanol not achieving projected cost reductions

Gate or Rack price of gasoline in June 2008:  
**\$3.00/Gallon**

# Effect of fall vs spring mow on yield and quality

## Fall Mow, Spring Bale:

- *Fall mow took place on November 25<sup>th</sup>, 2006*
  - 12' disc mower conditioner, cut height of 10.1 cm
- *Spring baling operations took place on May 3, 2007*
  - Raking was performed prior to baling

## Spring Mow, Spring Bale:

- *Spring mowing and baling operations took place on May 3<sup>rd</sup> and 4<sup>th</sup>, 2007*
  - No raking necessary

**FALL**

**WINTER**

**SPRING**

# Machine Harvested Recovered Yields

Treatment	Yield (ODT/ha)	Moisture Content (%)
Fall mow & spring bale	6.574*	6.0
Spring mow & bale	5.443	7.8

\*Significantly different ( $p < 0.05$ )

# Biomass Quality of Switchgrass vs. Wood Pellets and Wheat Straw

Unit	Wood pellets	Wheat straw	Switchgrass	
			Fall harvest	Overwintered Spring harvest
Energy (GJ/t)	20.3	18.6-18.8	18.2-18.8	19.1
Ash (%)	0.6	4.5	4.5-5.2	2.7-3.2
N (%)	0.30	0.70	0.46	0.33
K (%)	<b>0.05</b>	1.00	0.38-0.95	<b>0.06</b>
Cl (%)	0.01	0.19-0.51	n/a	n/a

# Creating clean combustion with very low particulates

- Pelleted fuel is better than bulk fuel
- Low content of K, Cl and S essential to reduce aerosol (fine particulate) formation
- Advanced Combustion technology (lambda control, condensing boiler)
- Use cyclone on combustion appliance to capture particulates

*Overall, particulate load as low as heating oil is achievable*

**Ontario greenhouse with multi-fuel coal/pellet boilers (3 x 800 kw)**

# Biofuel GHG Offsets Basics

GHG offsets are a function of several factors:

**The total amount  
of renewable  
energy (GJ)  
produced/ha**

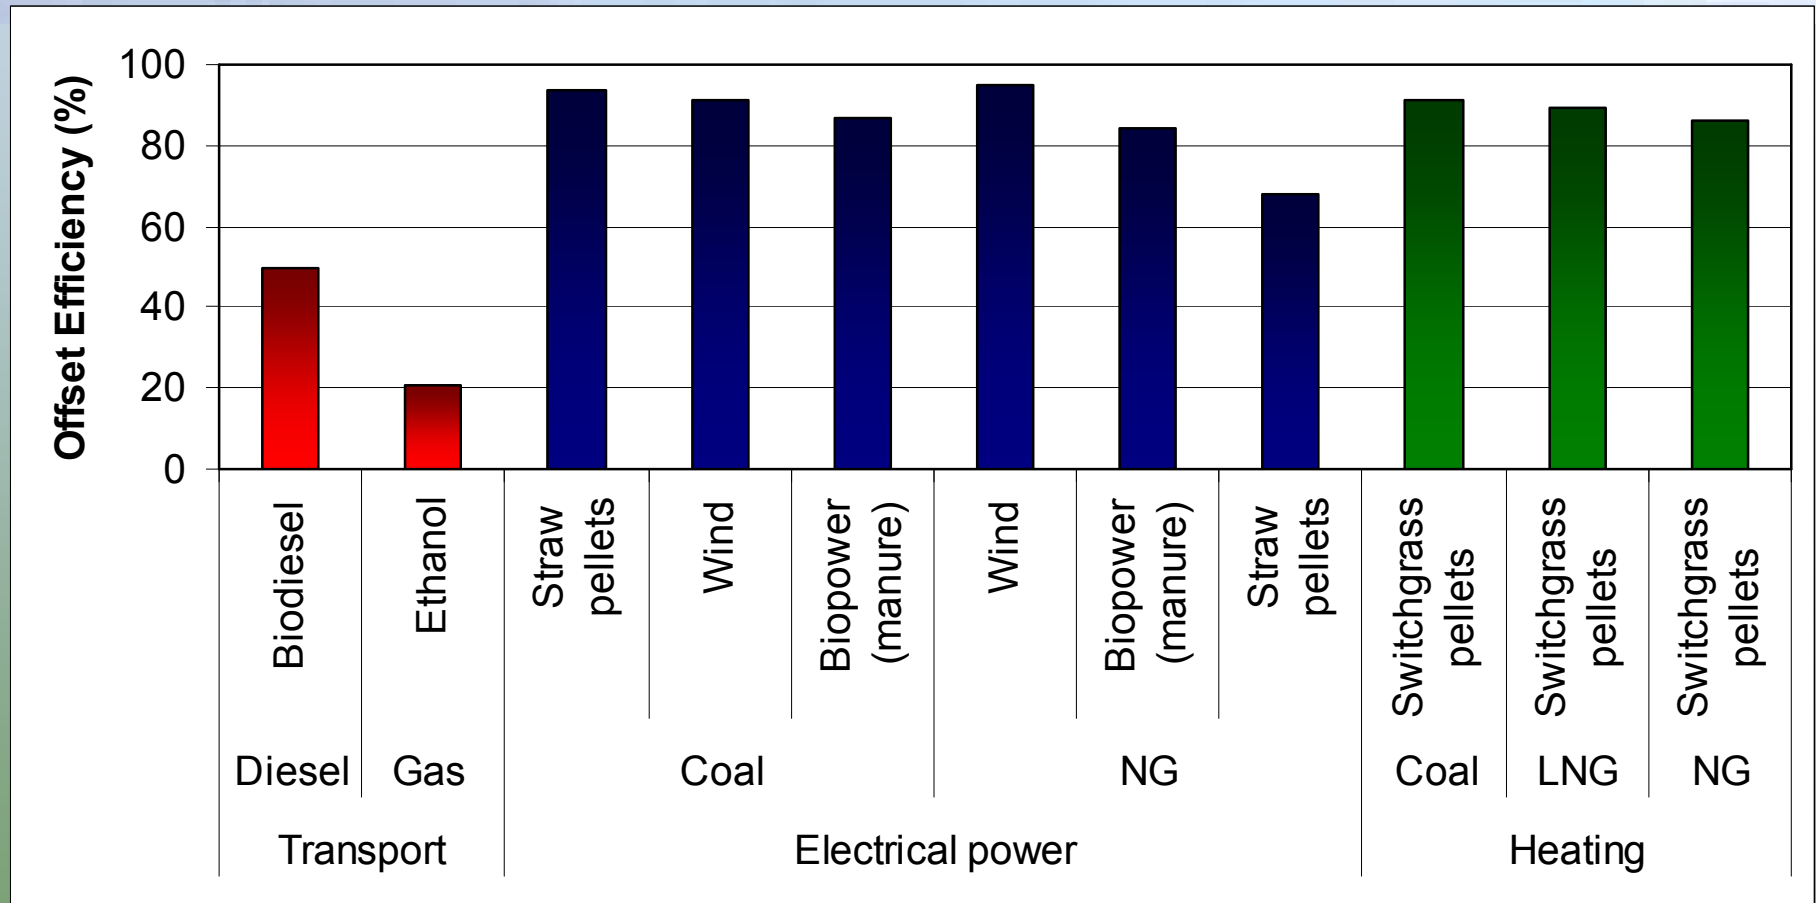

(solar energy collected  
in the field less energy  
lost going through the  
biofuel conversion  
process)

**The amount of  
fossil energy (GJ)  
used in the  
production of the  
feedstock/ha**

**The amount of  
fossil energy used  
to convert the raw  
feedstock to a  
processed biofuel  
form**

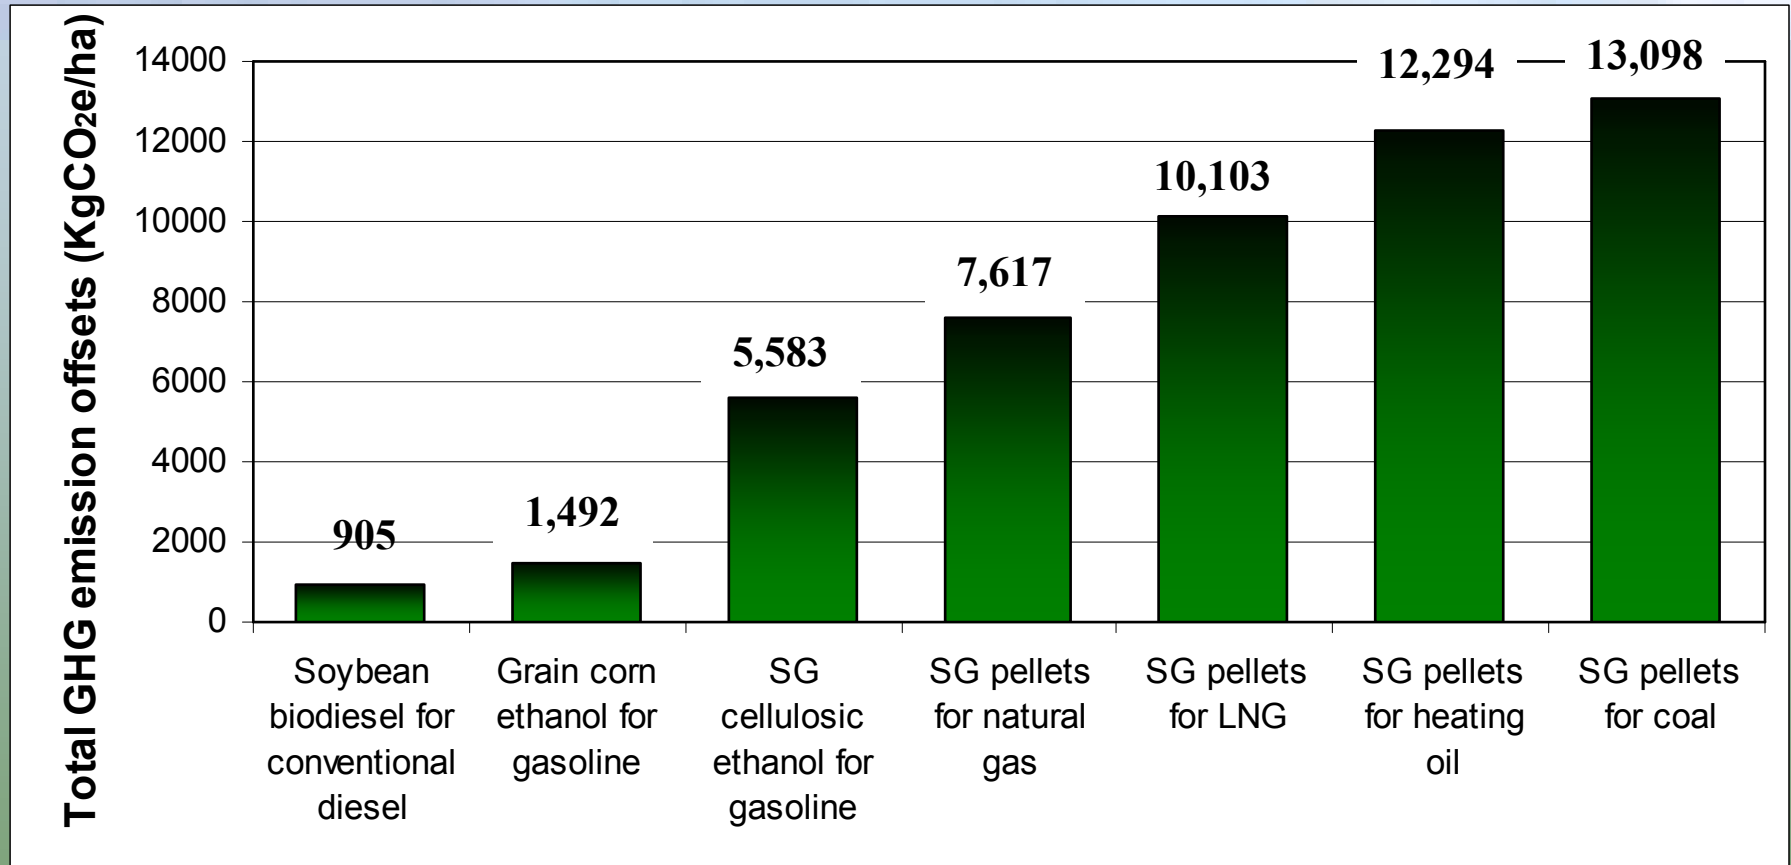

# Offset Efficiency of Biofuel Options

NG-natural gas; LNG-liquefied natural gas

Samson et al. 2008

# GHG Offsets From Ontario Farmland Using Biofuels (Samson et al 2008)

**SG=Switchgrass; LNG=Liquefied Natural Gas**

# Renewable Energy Incentives in \$/GJ in Ontario, Canada (Samson et al.2008)

**Corn Ethanol**

➡ \$8.00/GJ

**Wind Power Incentives**

➡ \$15.28/GJ

**Bioheat Pellets**

➡ \$2-4/GJ

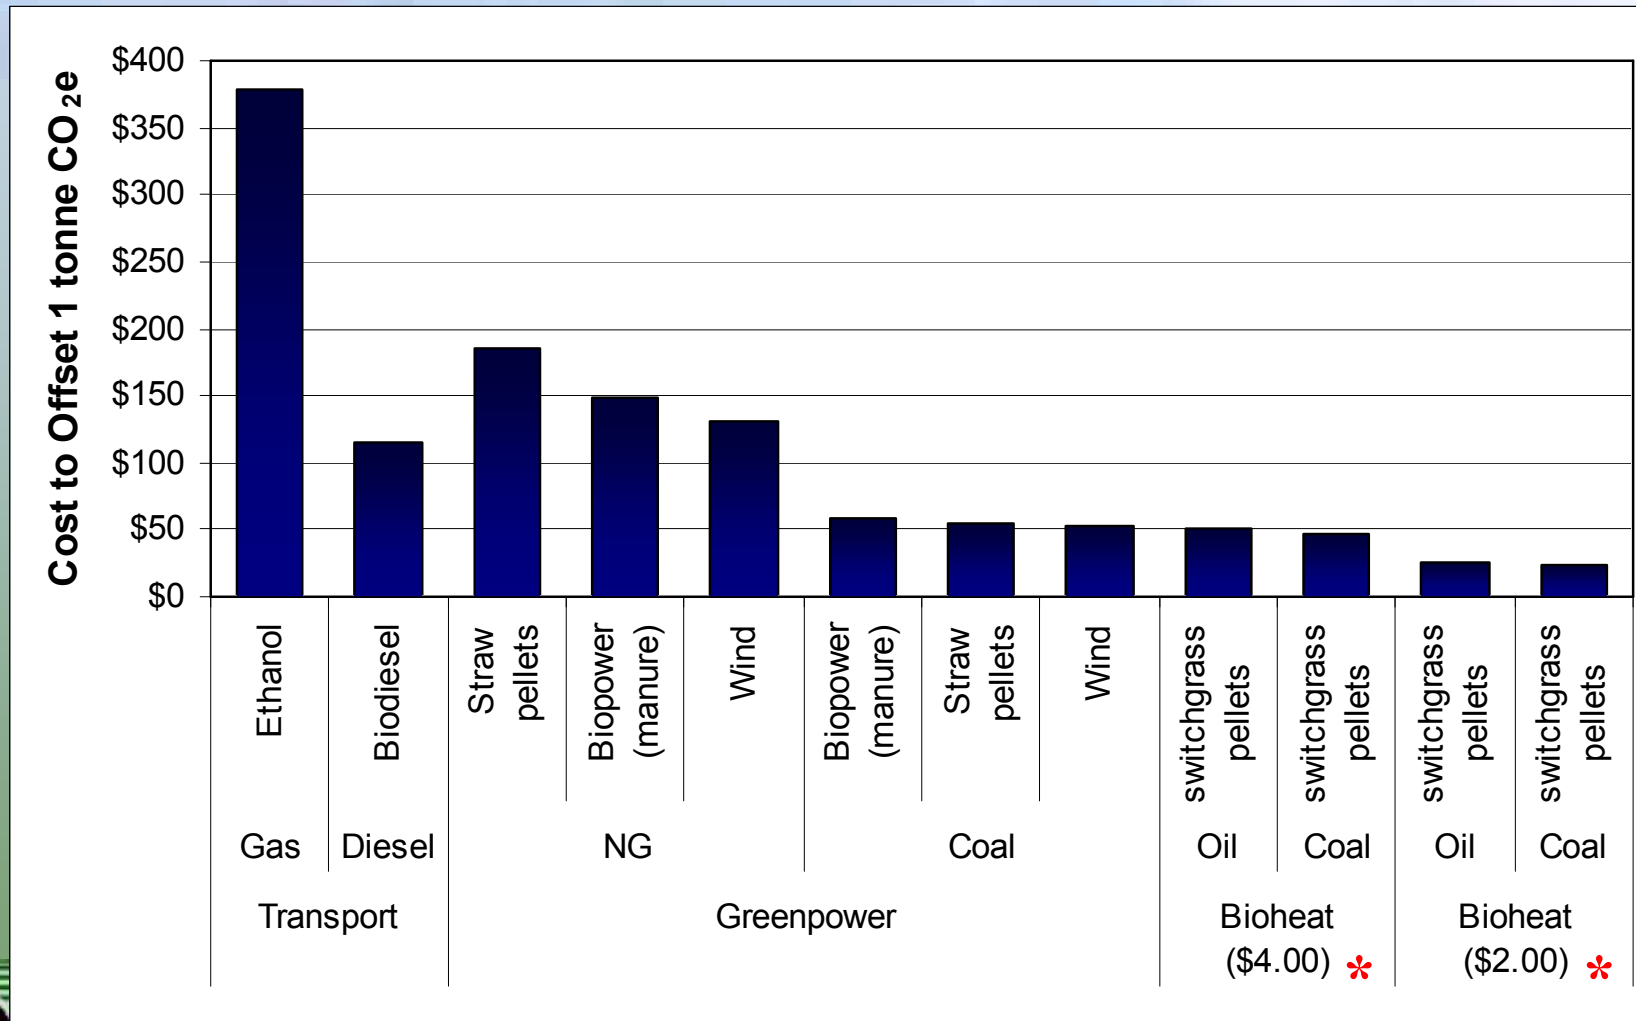

## *Incentive Assumptions:*

**Corn Ethanol** (0.021GJ/L @ \$0.168/L) based on \$0.10 federal + \$0.068 Ontario Ethanol Fund

**Wind Power** (0.0036GJ/kwh @ \$0.055/kWh) based on \$0.01 federal + \$0.045 province of Ontario

**BioHeat Pellets** (18.5 GJ/tonne @ \$37-\$74/t) currently no policy incentives are in place

# Costs required to offset 1 tonne CO<sub>2</sub>e with current Ont. & Federal Incentives

\*Suggested incentive

Samson et al. 2008

# Provinces need more progressive RET and climate change policy leadership from the federal government

- Need greater parity in the application of federal incentives (eg wind power \$2.78/GJ and \$5.00GJ ethanol and \$5.68GJ/biodiesel and nothing for biogas or bioheat)
- If CO<sub>2</sub> is the main policy rationale, we should use results based management approaches and reward technologies that appreciably reduce CO<sub>2</sub>

# Best Policy Instrument Options:

**I. Modest carbon tax of \$25/tonne CO<sub>2eq</sub>**

**II. Federal 1-2-3-4-5 Renewable energy and climate change program**

1. One national renewable energy incentive program
2. \$2/GJ Green heat
3. \$3/GJ Biogas
4. \$4/GJ Liquid biofuels and green power
5. 50% reduction in GHG required to qualify for incentives

# Thank You!
